### Abstract

This paper introduces a set of English grammar symbols that the author has developed to enhance students' understanding and consequently, application of the English grammar rules. A pretest-posttest control-group design was carried out in which the samples were students in two girls' senior high schools ( $N=135$ ,  $P \leq 0.05$ ) divided into two groups: the Treatment which received grammar lessons with grammar symbols; and the Control which received grammar lessons without the symbols. The experiment lasted for 30 hours spanned in three months. The statistical test revealed a significant higher gain scores for the Treatment group. Thus, the author strongly recommends using these symbols (or similar ones with the same characteristics) at least for two reasons. Firstly, students do not have to memorize all of them (72 tense symbols and 50 other symbols). That is, with just a few rules to learn, and then applying the existing algorithm, other symbols are easily shaped. Secondly, using these symbols enables teachers and students to have a general idea as to what to expect next because several grammatical rules and formulae can be predicted in advance.

**Keywords:** abstraction, algorithm, grammar symbols, prediction, tenses

## 1. Introduction

Thousands of years ago, Plato was the first to declare the ‘Super-sensory world of ideas’, that is to say, what we can perceive in this world is just a copy of a copy, or an imitation of imitation of what actually exists in another world (or perhaps our mind). For Plato, the mind was an immortal soul, the realm of all reason (Plato, 1961). Quoting Aristotle’s remarks in *Poetics*, Gombrich (1972), explains that answering why imitation should give man pleasure, i.e. why we enjoy looking at perfect copies of things we find painful to behold in reality, Aristotle attributes this pleasure to man’s inborn love of learning. In other words, “We find it appealing when we recognize things.” (p.12). Hence, we have the term ‘*catharsis*’ in the Ancient Greek drama which means ‘purification’, ‘emotional cleansing’, or ‘clarification.’

The current study tries to examine a similar perspective towards learning grammatical rules through some limited steps. Perhaps it is generally accepted that perceiving and then, implementing English grammar rules or principles play a crucial role in EFL/ESL situations. Proper language teaching and learning consist of knowing structural relations and the way in which they function in a certain language. The author believes that given the fact that English grammar is by nature very mathematical (i.e. there are finite rules with a few exceptions that make it possible to construct almost infinite number of English structures; e.g. sentences), then if we come up with a certain set of grammar symbols which follow some well-defined algorithms, this will eventually enhance the process of learning and internalizing the grammar rules in a faster and more reliable rate (both for students and teachers). Thus, in the present study, the author first introduces a list of symbols that he has developed, followed by an experimental design which discusses the immediate effects of learning these symbols in high school students achieving higher scores in standard typical English grammar tests. The author postulates that the viewpoints illustrated and the findings discussed in this paper can prove helpful to language practitioners and education policy makers.

## 2. Review of the Literature

### 2.1 Abstract Bits of Knowledge and Symbols

Donovan, Bransford, and Pellegrino (2003) argue that abstracted representations do not stay as isolated occurrences of events but become elements of larger, related events. Knowledge representations are built up through many opportunities for observing similarities and differences across diverse events. Halpern (2003) describes that we use our existing knowledge when we receive new information. Thus, the acquisition of knowledge is an active mental process. Each individual builds “extensive knowledge structures” that connect new ideas to what is known so that knowledge is always personal and somewhat idiosyncratic. Also, Stieglitz (1983) claims that previously acquired concepts and experiences help students in becoming successful in their language learning.

Ausubel (2000) believes that one major implication of the cognition is that the human psychological system, as being an information processing and storing mechanism, is shaped in a

form that allows new ideas and information to be meaningfully absorbed and saved most effectively when appropriately relevant and typically more inclusive concepts or propositions are already available to play a subsuming role to provide anchorage to subordinate ideas. Vygotsky (1978) encourages educators to utilize the process of scaffolding as a means of gradually guiding the learner through experiences to increase knowledge and skills while striving to make connections to existing schemas. Langer (1957) hypothesises that language evolved according to our need to represent reality in symbols. Gombrich (1972) also remarks that there are astronomical numbers of stimuli that impose on us, and that whatever can be coded in symbols can also be retrieved and remembered with relative ease.

Buzan (2006) has a similar stand in simpler terminology. According to him, if human brain receives data which is rapidly forgotten or disliked, it will reject further data in that subject area. Thus, the more information is presented to the brain in the given subject, the more it will block that information and the less learning is likely to occur, often eventually blocking the information altogether. On the other hand, if the brain receives information in an organized and memorable matrix, each new bit of information will automatically link to the existing information, naturally building into patterns of recognition, understanding, and memory that are called knowledge. Elsewhere when elaborating on *Mind Maps*, Buzan (2005) also uses the metaphor “grapping-hooks-on-memory” which according to him, will be created in order to attach new pieces of information into all the information already in there (the mind).

## 2.2 *The Role of Imagination in Shaping What We Know*

In his science-fiction journey (1989), “*A Galactic Odyssey: A Journey in Eight Parts*”, Gregory Benford - an astro-physicist, educator, and author – declares, “Some think language is the most distinctive feature of human beings, some favour these manipulative hands; personally, I believe it is our imagination.” Also, if we like watching movies, we will never forget Steven Spielberg’s *Jurassic Park* (1993). Nobody has seen dinosaurs, nobody has heard them, no one has felt them; however, Spielberg and his crew used their imagination in recreating these creeping creatures after 70 million years. As an example, it is interesting to notice that in order to design the roars of a *Tyrannosaurus rex* (T-rex), the sound effect team had successfully mixed the roars of a lion, with those of a crocodile, as well as a donkey’s bray! The outcome was that amazing, startling, terrifying sound which shocked the viewers and made the producers millionaires!

There are several traces for imagination as to how languages were developed in the first place, as well as the pedagogical implications of such evidence in the realm of language teaching a few of which will be touched in here. According to Bronowski (1978), while nonhuman creatures appear capable of emotion, there is something unique to our ability to use emotions and imagery in the apprehension of complex ideas. According to Shlain (1998, p.45), images are mainly mental productions of the physical world of vision. From a bio-evolutionary point of view, using pictures to communicate occurred much longer prior to writing. He then asserts, “Before there was writing there were pictures. The desire to control the forces of nature led Paleolithic humans to create images of the world around them.”

According to Egan (2005), imagination is not peripheral to the essence of education; rather it can allow students opportunities to express themselves in 'the arts.' Egan believes that stimulating students' imaginations and encouraging their creativity is an important part of helping students to make connections between school activities and real-life situations. As Dondis (1973) suggests, developing our ability to see would mean enhancing our ability to understand a visual message, or even create one. It is an integral part of the communication process which engages all concerns in the fine art, applied art, subjective expression, and response to functional purpose. According to Gombrich (1972), we are logically free to categorize things in any number of ways and order them according to any quality they might share.

Mental imagery is also the foundation of Paivio's (1971, 1981) Dual Coding Theory. Some neurobiological pieces of evidence support the argument in dual coding theory that the brain maintains functionally independent verbal and nonverbal representational and processing systems. In other words, different parts of the brain are specialized for processing information verbally and nonverbally. Likewise, Freire (1979, p.105), postulates that man is able to reflect on himself and on the activity in which he is involved. Man can free himself from the world in order to find his place in it and with it. Freire further states, "To enter into reality means to look at it objectively, and apprehend it as one's field of action and reflection. It means to penetrate it more and more lucidly in order to discover the true interrelations between the facts observed."

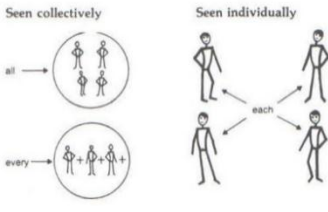

### *2.3 Usage of Symbols in Teaching English*

English grammar textbooks have used quite a number of visualization means like cartoons, caricatures, figures, real photos, etc. One might think of this usage as a continuum from highly concrete to highly abstract tools. At one end, we have the usage of real pictures like those used in Flynn, Rosenthal, Feigenbaum, and Butler (1998). Then, we have a mixture of real photos and cartoons like those in Kirn and Jack (1996), Mackay, Sherman, Forstrom, Pitt, and Velasco (2011), and Werner, Nelson, and Spaventa (1993). Then comes the usage of cartoons alone. This can be considered the most popular and frequent usage because there are many examples in the field, some of which are: Azar (1992), Eastwood (2002, 2013), Knepler (1990), Lites and Lehman (1990), Low (1986), Murphy and Altman (1989), Schoenberg (1994), and Seaton and Mew (2007).

A particular form of cartoons is the usage of stick figures such as those used in Allsop (1992). Then, we can see usage of diagrams or diagraming sentences which originally dates back to the late nineteenth century, developed by Alonzo Reed and Brainerd Kellogg (Haussamen, 2003). We can see examples of diagrams in Kaplan (1995) and Kolln and Funk (2012). The other tool is the usage of geometric shapes and lines. These images seem to be very useful when teaching English prepositions, types of nouns, and comparative or superlative adjectives. Some examples are: Allsop (1992), Bing (1989), Leech and Svartvik (1992), and Murphy (1993). And finally, there is the "abstract" usage of geometric shapes and lines at the end of the visualization continuum. This means that the graphs (or lines) used resemble the least to the real world. In other words, students should imagine the relation between the image and the idea (or grammatical rule) which it

introduces. Some examples of this type can be seen in Allsop (1992), Leech and Svartvik (1992), and Murphy (1993). Table 1 encompasses a few of the above-mentioned visual aids.

Table 1. Samples of visual aids used in English grammar text books

 <p>(Murphy &amp; Altman, 1989: 70)</p>	 <p>(Allsop, 1992: 66)</p>	<p>We can compare</p> <p>a Two objects or sets</p> <p><math>A = B</math> A is as big as B.</p> <p><math>A &gt; B</math> A is bigger than B.</p> <p><math>A &gt; \begin{matrix} B \\ C \\ D \end{matrix}</math> A is bigger than the rest of the other letters.</p> <p>b More than two objects or sets</p> <p><math>A \begin{matrix} B \\ C \\ D \end{matrix}</math> A is the biggest of all the letters in the group.</p> <p>(Allsop, 1992: 80)</p>
<p>Formal properties of English passives:</p> <ol style="list-style-type: none"><li>1. The actual subject is the "logical" direct object;</li><li>2. The logical subject, if present, is located toward the end of the sentence, preceded by <i>by</i>;</li><li>3. The auxiliary verb <i>be</i> is present;</li><li>4. The verb carries the past participle suffix.</li></ol> <p>For example:</p> <p>Actual Subject (note form) → He → was → arrested → by → them → Note objective case form</p> <p>Logical direct object → be → Past participle form of verb → by → Logical subject</p> <p>(Kaplan, 1995: 180)</p>	 <p>(Leech &amp; Svartvik, 1992: 51)</p>	 <p>(Leech &amp; Svartvik, 1992: 139)</p>
 <p>(Allsop, 1992: 109)</p>	 <p>(Leech &amp; Svartvik, 1992: 88)</p>	 <p>(Murphy, 1993: 148)</p>
 <p>(Allsop, 1992: 157)</p>	 <p>(Allsop, 1992: 107)</p>	<p>Here are four circles.</p> <p>The first circle is the largest.</p> <p>The next circle is smaller.</p> <p>It is the second circle.</p> <p>The last circle is the smallest.</p> <p>It is the fourth circle.</p>  <p>(Bing, 1989: 187)</p>

## 2.4 The Montessori Grammar Symbols

Although some of the examples mentioned above have a high level of abstraction, most probably, we cannot call them "symbols." The only true grammar symbols that the author has found in the related literature are those called, "Montessori Grammar Symbols" named after Maria Montessori, an Italian physician and educator. Tables 2 and 3 show these grammar symbols.

Table 2. Basic Grammar Symbols

	Noun		Verb
	Article		Adverb
	Adjective		Conjunction
	Pronoun		Preposition
			Interjection

Table 3. Advanced Grammar Symbols

	Proper Noun		Intransitive Verb		Gerund
	Abstract Noun		Auxiliary Verb		Infinitive
	Collective Noun		Linking Verb		Participle

*Note.* Data from [http://www.montessorialbum.com/montessori/index.php?title=Grammar\\_Symbols](http://www.montessorialbum.com/montessori/index.php?title=Grammar_Symbols) (Retrieved July, 2017)

### 3. Author's Proposed English Grammar Symbols

#### 3.1 Do We Even Need Grammar Symbols?

In this section, we are going to have a glance at the English grammatical structures and patterns in a new way. Before anything, let me ponder upon the following analogy: Think of two different workshops. In the first one, the owner puts all his tools orderly on some shelves. Every tool has its own unique tag and place, and you never get confused in finding a specific one. On the other hand, in the second workshop, the owner has all the tools that the first owner had (perhaps, even more), yet he puts all his tools in a big bag instead of arranging them on the shelves. Now, who is more successful? The answer is certainly the first owner. It is true that the second owner has all the needed tools, but finding them in that big bag takes him a lot of time and energy. However, the first owner has spent a reasonable time and cost in installing the shelves before. In addition, most of the time, the second owner is not sure of what he has. He has to look into his bag thoroughly for a special tool, while the first owner can find his needed instruments easily just by taking a look over the shelves.

The same story is true about many learners of English. That is, a majority of the learners learn a vast range of information about English, but they do not know how to apply this information. Various titles, repetitious approaches to grammatical structures, and the feeling that they are not applicable, all will result in having a bag full of information. Consequently, students do not recognize which piece of linguistic data is useful to make a linguistic structure (written or oral). It is very important to notice that the number of major English language rules is limited. What makes these rules so difficult is that every learner has to practically know a good amount of these rules to be able to claim they know English. It is worth mentioning that since there is a complete and subtle coherence among language components, and their linking patterns (called grammar), advanced students must practice apparently simple language components (that is, what the elementary students have to learn at the beginning, and what the advanced ones are supposed to already know) on a regular basis.

Thus, in this section, we are going to present a particular strategy based on innovative grammar symbols in order to make a kind of mentally-leading learning procedure. To get familiar with these symbols, learners do not have to memorize all of them at all. Far from that, with knowing just the patterns (and the algorithms among them), the students will be able to predict them. This is somehow similar to the predictability power which exists in the Periodic Table of the elements. Please note that in the next sections of part 2, the author will use a “process instruction” language style for both simplicity and brevity.

### 3.2 The First Five Basic Symbols

First of all, let us consider the following five very important symbols:

As you can see, these signs are not new, and you already know them. So, this means that whenever a learner randomly picks one of these symbols, he or she should make an English structure (oral or written) accordingly.

### 3.3 The Symbols for Tenses

First of all, let us agree upon some presuppositions on the tenses as follows:

- Triangle shapes stand for the past, circle shapes stand for the present, and rhombus shapes stand for the future.
- If these shapes **are not** perfectly shaded; that is to say, if they are simple, then they will show the simple tenses.
- If these shapes **are** perfectly shaded; that is to say, if they are filled with color, then they will show the perfect tenses.
- If two similar shapes overlap each other partially, this shows progressive tenses.
- Then, combining the last two presuppositions, the partially overlapped shaded shapes show perfect progressive tenses.

Consequently, we will have the 12 English tenses as the following illustrated in Table 4.

Table 4. Symbols for 12 English tenses

<i>Tense</i>	Past	Present	Future
Simple			
Perfect			
Progressive			
Perfect Progressive			

Now, remember the five signs introduced at the beginning which referred to negative structures, positive structures, all forms of questions, Y/N questions, and WH questions. We are going to use (9 × 6.5 cm.) cards in the classes. Then, if we just combine and incorporate these five symbols

with the 12 symbols for the tenses in these cards and interpret each card diagonally from left to right, we will have 72 cards which are listed in Table 5.

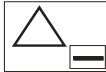

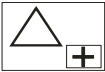

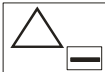

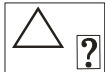

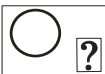

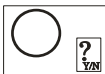

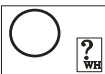

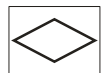

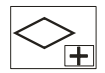

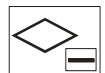

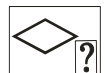

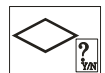

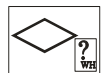

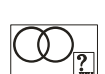

Here is an example: We know that  is the symbol of the simple past, and  indicates negative structures. Thus  means “Make a negative structure in the simple past tense.”

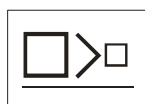

Table 5. The first set of the English grammar symbols (tenses)

Form	any structures	only positive structures	only negative structures	any questions	only Y/N questions	only WH questions
Tense						
Simple Past						
Simple Present						
Simple Future						
Past Perfect						
Present Perfect						
Future Perfect						
Past Progressive						
Present Progressive						
Future Progressive						
Past						

Perfect Progressive						
Present Perfect Progressive						
Future Perfect Progressive						

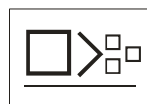

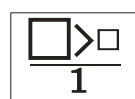

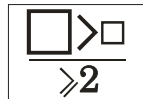

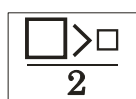

### 3.4 The Symbols for English Grammar Functions Other Than Tenses

Now that we have learnt about the Tense Symbols, let us have a look at some of the other signs and symbols which relate to some other grammatical patterns. Most probably, the logic behind each symbolic element is quite simple. I am also sure that you will soon discover the algorithm and learn all of symbols quickly.

Look at the following symbol:

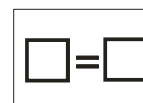

You must have seen this sign  $>$  in your math class. It shows that something is bigger than something else. Do you remember any similar concept in grammar? That's right: the *Comparative Adjectives*. Thus, based on the number of the syllables of the adjectives, i.e. one-syllable or two-syllable adjectives, or adjectives with two or more syllables, and according to the first symbol, we will have:

Now look at this symbol:

It shows that one thing is bigger than several things. As you have guessed, this concept is one of the most important usages of the *Superlative Adjectives*.

And again, based on the number of the syllables of the adjectives, we will have:

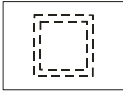

Applying a similar logic, we will have the following for **as...as** structures:

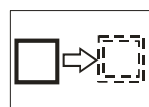

Now, let us look at the following:

which symbolizes all types of the conditional sentences. And so for the conditionals type one, two, and three, we will have:

Also, we can have  representing the active sentences, and  representing the passive structures. So, we will have:

Change active structures to passive ones.

Change passive structures to active ones.

Also,  symbolizes *Imperative* structures. Then, we will have:

positive imperatives

negative imperatives

### 3.5 General Notes

Now that you have learnt the Grammar Symbols, let us pay attention to the following points:

- \* The sequence in which these symbols are introduced here does not necessarily match the order of learning them. It has been so in this paper to make a clear classification.
- \* Cards with more than one symbol on them are interpreted diagonally from left to right.

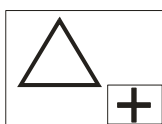

Example

indirect reported speech  
positive imperative sentences

- \* The tense symbols are printed in green, and the other grammar symbols are printed in red.
- \* You can often use two different categories of the grammar symbols (for example, a tense card and a non-tense one) together.

Example

Make a positive structure in the simple past, and use a superlative adjective of two or more syllables.

As you can see, one of the cards above indicates superlative adjectives with two or more syllables, and the other card illustrates positive simple past tense.

- \* Depending on your English level, you can also use several grammar symbols simultaneously together with other props. Use your imagination and produce what you like. The following is an example from Shirban Sasi (2006, p. 216).

Bill: Where are you going on holiday?

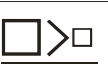

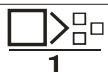

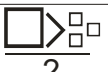

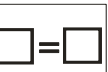

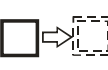

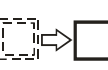

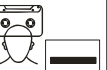

Sam: I suppose India.

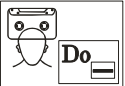

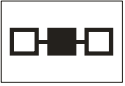

Bill: What a good idea! My father says, "India is one of the most amazing places in the whole world."

- \* Make sure to use each sign when you study the related lesson. Remember that you can easily learn the patterns existing among all the symbols in advance. However, when you want to apply them, learn the grammar first.
- \* The author introduced two types of workshop owners to you at the beginning of this chapter. Having learnt the Grammar Symbols: 1) You can classify your linguistic knowledge precisely, and 2) You can gain a general vision over what is there to be learnt later.

Now that you have been introduced the logic used for most of the symbols, let us have a look at them in Table 6. Hopefully, the algorithm used can be learnt quite quickly.

Table 6. The Second Set of the Grammar Symbols

						
nouns	singular nouns	plural nouns	adjectives	adjective + noun	verbs	sentences
						
positive structures	negative structures	questions	Y/N questions	WH questions	negative questions	adverbs
						
imperatives	positive imperatives	negative imperatives	requests	comparative adjectives (all cases)	comparative adjectives (1 syllable)	comparative adjectives (2 syllables)
						
comparative adjectives (2 or more s.)	superlative adjectives (all cases)	superlative adjectives (1 syllable)	superlative adjectives (2 syllables)	superlative adjectives (2 or more s.)	(as ... as) adjectives	exclamations
						
conditional sentences (all types)	conditional sentences (type 1)	conditional sentences (type 2)	conditional sentences (type 3)	coordinating conjunctions	active voice	passive voice
						
turn active voice to passive voice	turn passive voice to active voice	direct reported speech	indirect reported speech (all)	indirect rep. speech (positive)	indirect rep. speech (negative)	indirect rep. speech (all questions)

						
indirect rep. speech (Y/N questions)	indirect rep. speech (WH questions)	indirect rep. speech (all imperatives)	indirect rep. speech (pos. imp.)	indirect rep. speech (neg. imp.)	compound structures	complex structures

## 4. Material and Methods

### 4.1 Introduction

The purpose of the data collected in this pre-test post-test control-group study was to investigate the effects of applying the Grammar Symbols on the grammar learning of Iranian senior high school students.

### 4.2 Design of the Study

The pre-test post-test control-group design of the current study has the following characteristics as suggested by Creswell (2003, p.170):

- The experimental group A and the control group B were randomly assigned.
- Both groups took a pre-test and post-test.
- The experimental group received the new treatment (with grammar symbols).
- The control group received a conventional treatment (without grammar symbols).

Thus, the design can be shown as:

Group A	R	<u>O<sub>1</sub></u>	<u>X<sub>1</sub></u>	<u>O<sub>2</sub></u>
Group B	R	<u>O'<sub>1</sub></u>	<u>X<sub>2</sub></u>	<u>O'<sub>2</sub></u>

Furthermore, it should be stressed here that in order to exclude the author from the treatment (to avoid researcher bias), the author had previously trained some teachers to teach the treatment course with the grammar symbols.

### 4.3 Participants

As part of a larger project (for more information, see Shirban Sasi, 2004, 2006, 2009, 2012, 2017, and 2018) approved by the English Department of the Ministry of Education (Tehran's Office), the author trained about 50 teachers to use these symbols and incorporate them in their lesson plans. For the current study, a pre-test-post-test control-group design was carried out. Two equally experienced female teachers were randomly assigned to two girls' senior high schools in the northwest area in Tehran. Each teacher taught two classes in each school. Totally, there were 74 students in the first school (the Treatment group), and 68 students in the second school (the Control group). However, only 71 students in the first school, and 64 students in the second school were present in both pre-test and post-test sessions, and thus were counted in the final analysis. The goal of both schools was to review and cover English grammatical rules in order to enable students to prepare for the university entrance multiple choice exams. The language of instruction was Persian, and the teaching method in both groups was a variety of Grammar Translation Method. The only difference in the teaching was that the teacher in the first high school also made use of the grammar symbols. Each session was 90 minutes, the classes were held twice a week for three months. When

teaching, both teachers frequently introduced and used identical English multiple-choice test items in forms of handouts. These sample tests covered a variety of topics, the most important of which were: English main tenses, types of adjectives, question formats, conditional sentences, active/passive voice, coordination, conjunctive adverbs, and reported speech.

#### 4.4 Data Collection

A 100-item multiple-choice grammar test was adapted and developed by the author based on the typical annual university entrance English tests. The test was meant to assess students' English grammar knowledge, and not their English vocabulary. Some of the questions used on this test are given in Appendix A. The pre-test took place one session prior to the lessons, and the post-test was administered one session immediately after the classes were over. Consequently, each individual student's gain score was calculated. Only correct answers were marked, therefore, unanswered test items or wrong answers were disregarded. Appendix B encompasses the scores of all the students in the two groups.

#### 4.5 Research Question and Hypothesis

Based on the main objective of this experiment; that is, to examine any probable effects the usage of grammar symbols might have, the following research question, and hence, null hypothesis and directional hypothesis were shaped.

1. Is there any significant difference between the English grammar learning gain scores by the Iranian high school students who used the Grammar Symbols, and the English grammar learning gain scores by those who did not use Grammar Symbols?

H<sub>0</sub>1- There is no significant difference between the English grammar learning gain scores by the Iranian high school students who used Grammar Symbols, and the English grammar learning gain scores by those who did not use Grammar Symbols.

H<sub>1</sub>- The Iranian high school students who used the Grammar Symbols will have higher English grammar learning gain scores than those who did not use the Grammar Symbols.

### 5. Data Analysis

Since the statistical test used in this study was an independent samples t-test, the three assumptions of independence of observations, normality of the distribution of the scores, and homogeneity of the variances had to be met first. As stated earlier, the treatment and the control samples were randomly assigned into two different high schools. Also the two teachers had no idea as to what teaching material and techniques the other teacher was using. Thus, the independence of observations has been fully maintained in this study.

Then as for the normality of the distribution of the scores in the population is concerned, we should look at the descriptive statistics results including the K-S test as shown in Table 7.

Table 7. Descriptive statistics for the gain scores

	Statistic	Std. Error
Scores Mean	9.4148	.42077
95% Confidence Interval Lower Bound for Mean	8.5826	
Upper Bound	10.2470	
5% Trimmed Mean	9.4630	
Median	9.0000	
Skewness	-.202	.209

Table 7 shows that the mean of 9.41 is very close to the median of 9.00 in both groups. We can also look at the skewness statistics. Here, we can see that the skewness value of -.202 is small relative to the standard error of .209, so the skewness is not a problem here. Also, the K-S test of normality gives us a significant  $p$  value of .20 suggesting that the distribution of gain scores is normal.

Then in order to determine whether the assumption of the homogeneity of the variances has been met, we should investigate the results of the independent samples t-test as shown in Table 8.

Table 8. Independent Samples Test for the gain scores

Levene's Test for Equality of Variances t-test for Equality of Means									
	F	Sig.	t	df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	95% Confidence Interval of the Difference	
								Lower	Upper
Score Equal variances assumed	1.198	.276	4.124	133	.000	3.28433	.79645	1.70899	4.85968

Equal variances not assumed	4.179	130.0 24	.000	3.28433	.78600	1.72933	4.83933
--------------------------------	-------	-------------	------	---------	--------	---------	---------

In Table 8, the significance value of the Levene's Test is .276 which is larger than .05. This means that the assumption of homogeneity of the variances of the scores for the population for this test has been met. Thus, we should use the first line in the table, which refers to "equal variances assumed." Therefore, in the current test, we have  $t(133) = 4.124$ ,  $p = .000$ . As the  $p = .000$  is less than the required cut-off value of .05, the null hypothesis is rejected and we can conclude that there is a statistically significant difference in the English grammar gain score between the control and treatment groups. Moreover, as for the direction of the difference, we can see in Table 9 that the mean English grammar gain score of 10.97 for the treatment group is larger than the mean English grammar gain score of 7.68 for the control group. Thus, we can conclude that, as the alternative directional hypothesis conveys, those students who were taught with the Grammar Symbols have higher grammar gain score than those who did not use the grammar symbols.

Table 9. Group statistics

	Group	N	Mean	Std. Deviation	Std. Error Mean
Scores	1.00	71	10.9718	5.13801	.60977
	2.00	64	7.6875	3.96763	.49595

As the hypothesis has been explored, we need to calculate the effect size statistics which provides us with an indication of the magnitude of the differences between the two groups. A common way to do this is to calculate the eta squared. Since SPSS does not provide eta squared values for t-tests, we should do the calculations on our own using the information provided in the output. The procedure for calculating and interpreting eta squared is by using the following formula as described by Pallant (2005):

$$Eta\ Squared = \frac{t^2}{t^2 + (N - 1)}$$

$$Eta\ squared = \frac{4.124^2}{4.124^2 + (71 + 64 - 2)} = .11$$

According to Cohen (1988), the guidelines for interpreting this value are: .01=small effect, .06=moderate effect, .14=large effect. Thus, we would claim that the effect size of .11 for this test is rather a large effect. Then, if we multiply this value by 100, we can have the percentage, meaning that approximately 11 percent of the variance in English grammar gain score is explained by the two different treatments.

## 6. Discussion

In this article, the author has introduced some symbols in order to ease teaching and learning English grammar rules. As elaborated earlier, these symbols proved to be helpful because in the experiment, in two high schools, the students under instruction with these symbols scored better than the control group. Being “symbols” by definition means that the symbols do not directly relate to the entity they convey. That is the main difference between these grammar symbols and the other means of visualization used in the English grammar books, as briefly explained before.

The author assumes that one reason students might find it difficult to learn grammatical rules is because of their intangible titles. Thus, changing these titles to something much more touchable would be useful. As Aristotle states, students enjoy looking at perfect copies of things (symbols here) they find painful to behold in reality (the grammar rules). Moreover, the author’s use of symbols in this article conforms to the arguments of Donovan, Bransford, and Pellegrino (2003) in that abstracted representations do not stay isolated. Then, the use of existing knowledge on the part of the students and teachers echo Halpern’s (2003) and Stieglitz’s (1983) findings. Also, as for the usage of algorithms in shaping the symbols, the author’s suggestions comply with the description of cognition by Ausubel (2000). In terms of how students find it easier to memorize English grammar rules with the grammar symbols, one might recall Buzan (2005, 2006) in that these symbols might help construct better, and more comprehensible memorable matrixes. These symbols may as well provide students with the guiding scaffolding needed as argued by Vygotsky (1978).

Nonetheless, the symbols discussed in this paper vary from the Montessori symbols in the following ways:

- The Montessori symbols make use of the same geometric shapes (with a little difference in angle, size, and color) to convey different concepts.
- Color has been used in these symbols as a differentiating factor. It is true that colors add to the aesthetic quality of these symbols; however, they might be problematic in black and white copies, and also to color-blinded language learners.
- These symbols do not interact with one another.
- These symbols do not go any deeper; i.e. there is only one usage for each, and they do not explain details, relations, and range of use, etc.
- There is no predictability adhered to these symbols.

## 7. Conclusion

The current study dealt with introducing a set of grammar symbols which the author has developed. An experiment regarding how high school students may benefit from them has also been described and discussed. Perhaps what makes the author's symbols useful is both the simplicity of learning them (not memorizing them), and the fact that the algorithms used are quite conceivable. Ironically, though, the author believes that even his long list of grammar symbols presented in this article is neither enough nor conclusive. These symbols have covered a lot of topics, yet not all of the topics pertinent to the English grammar. In other words, for different contexts such as various learners' age, background, nationality, needs, purpose of learning, etc., we can come up with new symbols and new algorithms. As an example, please look at an alternative set of symbols for the English grammar tenses in Table 10 below. The author also postulates that similar algorithms might be employed to facilitate learning grammar rules of other languages as well. Finally, the author recommends the following topics for relevant future researches in the field:

- Studying larger number of high school participants of both genders,
- Examining the effects of these grammar symbols on EFL/ESL university students,
- Investigating probable differences between males and females in using grammar symbols,
- Exploring the effects of these grammar symbols on different age, and/or English proficiency levels,
- Observing other language learners using these symbols in the other cities in Iran, or in other countries,
- Exploring the adaptability of teaching these grammar symbols along with conventional methods, and
- Soliciting teachers who have used these grammar symbols, and those who are willing to.

Table 10. Alternative Symbols for 12 English tenses

<i>Tense</i>	Past	Present	Future

**Appendix A: A sample of the English grammar pretest and posttest used in this research. (The item numbers correspond to the real number of the item in the original test.)**

- 5- Her brother doesn't \_\_\_\_\_ smoking.
- a) like c) liking  
b) likes d) liked
- 10- I \_\_\_\_\_ the DVD back to Jack after I \_\_\_\_\_ watching it.
- a) take / finished c) took / had finished  
b) have taken / have finished d) had taken / finished
- 15- I'm sorry, I can't help you just now. I \_\_\_\_\_ lunch.
- a) will cook c) cook  
b) am cooking d) cooked
- 20- I'll be ready in \_\_\_\_\_ minutes.
- a) a lot c) much  
b) a little d) a few
- 25- I think that my house is \_\_\_\_\_ yours!
- a) dirty c) the dirtiest  
b) dirtier than d) dirtier
- 30- If Sarah \_\_\_\_\_ a watch, she \_\_\_\_\_ always late.
- a) will have / won't be c) has / is  
b) had / isn't d) had / wouldn't be
- 35- I like Reza, \_\_\_\_\_ I don't like his brother.
- a) and c) nor  
b) but d) so
- 40- The teachers in my school \_\_\_\_\_ a new supervisor.
- a) have been elected c) has elected

- b) have elected d) was elected
- 45- He gave her a CD player \_\_\_\_\_ stopped working after three weeks.  
a) that c) when  
b) who d) where
- 50- I always take a shower \_\_\_\_\_ I go to bed.  
a) when c) before  
b) if d) until
- 55- We began \_\_\_\_\_ about our wedding plan a few months ago.  
a) talked c) talking  
b) talks d) talk
- 60- Mary \_\_\_\_\_ work very hard because of the important exam she has next week.  
a) am having c) has to  
b) had to d) have to
- 65- There were not \_\_\_\_\_ people at the stadium yesterday.  
a) many c) much  
b) a few d) a little
- 70- Afrikaans is \_\_\_\_\_ in South Africa.  
a) speaks c) spoke  
b) spoken d) be spoken
- 75- He \_\_\_\_\_ the address, so I helped him out by a map.  
a) forgets c) forget  
b) has forgotten d) had forgotten
- 80- We met at the train station. I'd rather we \_\_\_\_\_ here.  
a) meet c) would meet  
b) met d) had met
